Eustilbum Rabenh.

The resinicolous discomycete originally described with its sexual state named *Bisporella resinicola* and asexual state *Eustilbum aureum*, was shown by Mitchell et al. (2022) to be a monotypic genus in *Helotiales* with no clear family-level relationship. These authors showed *Bisporella* to be polyphyletic, the *Eustilbum* name accepted for *B. resinicola*.
