Goniopila Marvanová & Descals

The type of the monotypic genus *Goniopila*, *G. monticola*, is an aquatic hyphomycete, morphologically similar to *Margaritispora* with its globose and protuberate conidia, but differing in having short monilioid conidiophores branched at the base and polyblastic conidiogenous cells ([Marvanová & Descals 1985](#)). ITS sequences from isolates identified as the type species (GenBank MK353141, voucher DSM 104367) place the genus within *Helotiaceae* (P.R. Johnston, unpubl. data).
