### *Halenospora* E.B.G. Jones

*Halenospora* is one of the aquatic hyphomycetes in *Leotiomyces*. Known only from its asexual state, its conidia comprise irregular coils of globose, dark-walled cells. *Halenospora varia* is the type species, Jones et al. (2009) basing their new genus on DNA sequence data from ATCC 28788 (AF169303, MF5849 ex Bills et al. 1999, incorrectly cited as ATCC 28878). This places the genus in *Tricladiaceae* (Johnston & Baschien 2020).
