

Outlineoffungi.org - Note 190, [Guayaquilina](#)

[Guayaquilina](#) R.F. Castañeda et al.

[Guayaquilina](#) was established by [Magdama et al. \(2020\)](#) to accommodate *Idriella cubensis* based on morphology and phylogenetic analysis. It is characterized by macronematous, tree-like, fasciculate, profuse dichotomously, alternately, or irregularly branched, brown conidiophores with polyblastic, denticulate, sympodial extended, intercalary and terminal conidiogenous cells that produce solitary, sublunate, subnavicular, lunate, inequilateral, (0–)1-septate, hyaline conidia ([Magdama et al. 2020](#)) (M. Erdoğan).
