

**Outlineoffungi.org - Note 192, [Halocryptosphaeria](#)**

[Halocryptosphaeria](#) Dayar. et al.

This genus is saprobic on decaying wood of *Avicennia marina*. It is characterized by poorly developed entostroma, dorsally limited by a black zone binding the stromatic area, submerged or occasionally deeply buried long-necked ascomata and olive-brown, aseptate ascospores ([Dayarathne et al. 2020](#)) (F. Selcuk).
