

## Outlineoffungi.org - Note 30, *Annelosympodia*

*Annelosympodia* McTaggart et al.

*Annelosympodia*, with *A. orbiculata* as the type species, was introduced by [McTaggart et al. \(2007\)](#). *Annelosympodia orbiculata* is characterized by an unusual combination of features, viz., fasciculate conidiogenous cells (conidiophores reduced to conidiogenous cells), holoblastic conidiogenesis with sympodial, but rectilinear proliferation leaving annular structures and lateral conspicuous conidiogenous loci, and rhexolytic conidial secession ([McTaggart et al. 2007](#)) (M. Erdoğan).
