[Parachaetomium](#) Mehrabi et al.

Based on morphological characteristics and multilocus phylogeny, [Mehrabi et al. \(2020\)](#) introduced this genus to accommodate *Chaetomium carinthiacum*, *C. iranianum*, and *C. truncatulum*. [Parachaetomium](#) is characterized by distinctly ostiolate ascomata and equi- or inequilaterally fusiform, typically less than 13- μ m-long ascospores with an oblique or subapical germ pore ([Mehrabi et al. 2020](#)) (M. Erdoğan).
