

Outlineoffungi.org - Note 485, [Stephanophorella](#)

[Stephanophorella](#) Réblová & Hern.-Restr.

[Stephanophorella](#) was introduced by [Réblová et al. \(2021a\)](#) to accommodate *Zanclospora stellata*. [Stephanophorella](#) resembles *Zanclospora* in setiform conidiophores and the arrangement of sessile, lateral phialides, but differs mainly in well-defined collarettes and the dark, opaque, setiform part of the conidiophore with branches inserted in a stellate fashion at the apex ([Réblová et al. 2021a](#)) (M. Erdoğdu).
