

Outlineoffungi.org - Note 522, [Tubulicolla](#)

[Tubulicolla](#) Réblová & Hern.-Restr.

Based on the multigene analysis, [Réblová et al. \(2021b\)](#) revealed that [Tubulicolla](#) is a member of the [Vermiculariopsiales](#), distantly related to *Dictyochaeta*, and introduced [Tubulicolla](#) to accommodate *D. cylindrospora*. [Tubulicolla](#) is characterized by upright, fertile setae formed on stromatic cells and encircled by shorter, unbranched conidiophores terminating in monophialides with a tubular neck below the funnel-shaped collarete and hyaline, aseptate, smooth conidia ([Réblová et al. 2021b](#)) (M. Erdoğdu).
