[Kaziboletus](#) Hosen & Zhu L. Yang

[Kaziboletus](#) was introduced to accommodate the new species [K. rufescens](#) found in tropical Bangladesh. It is putatively associated with *Shorea robusta*, morphologically resembling *Leccinum*, [Leccinellum](#), and *Spongispora* but is genetically distinct. The four-gene (nrLSU, TEF1- α , RPB1, and RPB2) phylogenetic analyses indicated its distinct position in the subfamily *Leccinoideae* of [Boletaceae](#). Its closest sister relationships with other genera in *Leccinoideae* remains unclear.
