[Nimesporella](#) Réblová & Hern.-Restr.

[Nimesporella](#) is a monotypic genus based on [Nimesporella capillacea](#) (Réblová et al. 2021). [Nimesporella](#) is closely related to *Codinaea* but without significant statistical support in the phylogenetic analyses performed in [Réblová et al. \(2021\)](#). This genus is characterized by macronematous, mononematous, brown, unbranched conidiophores, polyphialidic conidiogenous cells, and ellipsoidal, hyaline, aseptate conidia with a setula at each end ([Réblová et al. 2021](#)). It is saprobic occurring in freshwater and terrestrial habitats.
