

## Outlineoffungi.org - Note 70, [Blastophragmia](#)

[Blastophragmia](#) Jian Ma et al.

[Blastophragmia](#) was introduced by [Ma et al. \(2021\)](#) based on *B. plurisetulosa* collected on dead branches of unidentified plants in Hainan Province, China. The fungus is distinguished by macronematous, unbranched, determinate or percurrently extending conidiophores, and solitary, acrogenous, fusiform to ellipsoidal, 3-euseptate, smooth, brown conidia with a single apical setula and 2–4 basal setulae, seceding rhexolytically from monoblastic, integrated, terminal conidiogenous cells ([Ma et al. 2021](#)) (M. Erdoğan).
