

## Outlineoffungi.org - Note 78, [Brahmaculus](#)

[Brahmaculus](#) P.R. Johnst.

[Johnston et al. \(2021\)](#) introduced [Brahmaculus](#) in *Chlorociboriaceae* to accommodate four new species. All species of the genus have bright yellow apothecia with several apothecial cups held on short branches at the tip of a long stipe. They differ from species referred to *Chlorociboria* the only other genus in *Chlorociboriaceae*, in their terrestrial habitat and ascomata that are noticeably more hairy than the known *Chlorociboria* species, most of which have apothecia with short, macroscopically indistinct hair-like elements ([Johnston et al. 2021](#)) (M. Erdoğan).
